Man-made climate change....The myth and media hysteria.

The Man-made climate emergency myth is the biggest Hoax of the Century with science being subjugated by over liberalized political will and media hysteria at a level not seen before.

The media hysteria has reached a point that reasonable fact based debate on the subject is impossible due to the almost religious fanaticism from “the believers” that man-made climate change is an Armageddon that requires a colossal level of immediate global action. Our governments are being railroaded into policies that will cripple the progress and sustainability of our modern civilization.

We lack Scientific Consensus.....

Many politically motivated study groups have said.....

“It is extremely likely that human influence has been the dominant cause of the observed warming since the mid-20th century”. They believe that future climate change will cause higher temperatures, Lower temperatures, more snow and blizzards, Drought, fire, and floods, Rising sea levels, Disappearing glaciers ,loss of sea ice at the poles, Species extinction, more and stronger storms, more storm damage, more volcanic eruptions, dying forests, death of coral reefs and shellfish, shutting down the Gulf Stream, fatal heat waves, more heat-related illness and disease, crop failure and food shortages, Millions of climate change refugees, Increased cancer, cardiovascular disease, mental illness, and respiratory disease, and some say a devastating effect on the quality of French wines!

However, many credible scientific experts are now saying....

“there is no convincing evidence that human release of carbon dioxide although it has increased will in the foreseeable future cause a catastrophic heating of the earth’s atmosphere and disruption of the earth’s climate”...

The global climate is always changing over very long periods and at this time frame it is slightly warming .. But it’s NOT significantly due to human activity or Carbon Concentration and It is NOT cause for alarm and may even be beneficial....

This global warming over the last century has been slow and has stopped increasing and has reduced in the last decade

We at present have far less global ecological issues such as forest fires, floods and storms than in recent history.

Carbon dioxide (CO₂) concentration has increased for many reasons other than humankind. But on balance, it may be a good thing as it is increasing plant growth on the planet and improving the food supply across the whole ecological structure of the planet.

The Paris accord with its focus on climate change and demanding a carbon and energy austerity program is just so much wasted political arm waving at the international level. Such policies are not in the best interests of the western world and President Trump was correct in de-committing the USA from such an expensive and economically destructive agreement...

The real enemy is Pollution not climate change..

Reducing our dependence on dirty carbon fuels is a worthy goal but it will be a very slow process...

We do need to focus on clean and sustainable sources of energy as a modern society needs energy to thrive and this need will increase in most economies.

The only viable and cleanest solution is to switch to nuclear power. Solar and Wind are Non-Strategic and Impractical and just cannot support an advanced economy that needs energy 24/7 in enough and uninterrupted amounts. Hydro power and some other clean energy solutions may assist, but we need a nuclear strategy now, and this is being accelerated by most nations to move away from energy alternatives which have a much higher pollution footprint.

In the western world we badly need to reshore our manufacturing to enable a balanced economy of resources manufacturing and services. Also, relocating manufacturing closer to these largest consumers will significantly reduce wasteful trade across oceans that will assist in cleaning up the over polluted oceans by the reduction of such duplicitous trade and the burning of such wasteful and dirty bunker fuel used by the container ships.

Further by ensuring populations as much as practical grow mine and make what they consume we will reduce pollution created through badly controlled manufacturing in poor countries and better force manufacturing to "clean up" rather than pollute its own consumers.

We must strive to continue to clear up this myth and ensure our governments get the story and the policies straight as the adoption of carbon taxes and energy restrictions that support the myth of man-made climate change will make it very difficult for prosperity to continue across the globe, with disastrous results for both mature and emerging economies.
